

# AUC vs severity, colleague-group3's corruption suite (independent check, not part of mean\_area)

tag area per family (no suite mean: see the note)

|                                                                                                              |                  |                       |                          |
|--------------------------------------------------------------------------------------------------------------|------------------|-----------------------|--------------------------|

c\_edge\_truncation keeps eta <= -3+6s OR eta >= 3-6s (E): the half-planes overlap from s = 0.5, so its s >= 0.6 points are 'drop nearly everything by a per-event coin flip', not edge truncation. Read that panel below s = 0.6 only.
