

WP-J J1: Group 3's five TRAINING families, ported verbatim (their eta [-3,3] replaced by ours). Blue survives, grey x dropped, marker area $\sim \log pt$

Every panel is ONE event, so its dropped fraction is a single sample, not the family's expectation.
 The bottom ladder tracks s closely for this event; over 4000 events c_rect reaches 0.841 at s=1.0, not 1.00.
 The per-family calibration is the claim; the table is in reports/j-0345.md.
